

Do you or someone you know have CYSTIC FIBROSIS? Join the study to help advance CYSTIC FIBROSIS treatment

PHAGE TRIAL

Cystic fibrosis patients are at risk for antibiotic-resistant bacteria. Phage therapy uses viruses to attack difficult-to-treat bacteria. We are conducting a clinical trial to determine if the use of phage can improve the health of patients with CF with *Pseudomonas aeruginosa* in their sputum.

DO I QUALIFY?

- You have been diagnosed with cystic fibrosis
- You are at least 18 years old
- You are colonized with *Pseudomonas aeruginosa*
- You have an FEV1 of at least 20%

LOCATION / COMPENSATION

There are a number of participating sites across the United States. Participants may be compensated for travel and lodging expenses.
